It is very easy to ruin an image with Photoshop. Because of this, we suggest that anyone new to digital image editing try a similar program like Adobe Photoshop Elements (www.adobe.com/products/photoshop/elements.html) or Gimp (www.gimp.org). Both programs cost less than \$60. The high price of Photoshop discourages many professionals from using Photoshop. A regular edition of Photoshop will set you back around \$800. Q: C++11 is the newly introduced version of C++? Is C++11 the newly introduced version of C++? Thank you A: No, it is the previous version. C++11 was intended to be a continuation of C++98, but at the same time they introduced some backwards incompatibility (which is, I guess, the reason of the "newly introduced" thing. The language was frozen with the C++98 standard in 1999, and since then they have changed a lot. If you mean C++03, then it is the previous version. The new version is C++14. If you mean other languages than C++, then they are also "newly introduced" in comparison. A comparative study of the efficacy and tolerability of low-dose intravenous rivaroxaban at point of care versus prophylaxis in hip fracture surgery. Rivaroxaban at low dose is a novel anti-Xa inhibitor that is effective and safe for the prevention of venous thromboembolism (VTE) in patients with acute hip fracture. Given the lack of long-term data in this setting, we compared the efficacy and tolerability of rivaroxaban at point of care (POC) versus prophylaxis in patients undergoing hip fracture surgery. This open-label prospective, randomised, multi-center trial compared POC rivaroxaban at 15mg BID versus VKA prophylaxis. The primary efficacy endpoint was symptomatic VTE as adjudicated by independent blinded investigators. Safety was assessed by reporting adverse events (AE). A total of 746 eligible patients were enrolled and 724 (97.1%) were included in the full analysis population. Non-inferiority of POC rivaroxaban versus prophylactic anticoagulation was demonstrated. POC rivaroxaban reduced the risk of symptomatic VTE to a rate of 4.6% compared with 10.8% in the control group (HR 0.21, 95% CI, 0.05 to 0.88; p=0.034). Treatment with POC rivaroxaban was associated with more frequent major bleeding (defined as BARC \geq 2) than VKA prophylaxis (3.1% vs 0.4%, p=0.005). Non-inferiority of rivaroxaban at P
