the default kits are excellent. the drum kick sounds punchy, and the toms and hi-hats sound full and powerful. the cymbal hits are authentic sounding and very responsive to your playing. the drum fills are also very solid, and the snare is brilliant. as with many other samples of this nature, however, it's the cymbals that really shine. the snares, hats and toms are big and booming, the hi-hats are crisp and sharp, and the cymbals crack and crash with authenticity. it's pretty rare to find samples that sound this good and, when you do, you realise how rare it is. battery 2 includes a wide range of presets for each kit type, and although the ones that are included are very good, i would have liked a greater choice of presets. the level of difficulty and musicality of the preset selections is really impressive, and the inclusions are perfect for many different kinds of drumming. the bass drum is particularly impressive and very wide in range, and the snare sounds great, both in the factory presets and the ones you create yourself. the kick drum sounds have a lot of punch and body, and the hi-hats are plenty full and powerful. although the cymbals might be lacking in variety, the ones that are included are very good, and the hats and toms are excellent. there's nothing obvious or glaringly bad about the sound of any of the kits, but i feel that some of the acoustic kits could have been improved. you can import external midi files, and you can export a midi file to send to a midi sequencer, which then can be imported into battery. midi import and export is a feature that will be good news to many users, not just for this reason. if you have a small, mid-priced or older-generation midi sequencer that doesn't import midi files, this may be the only way to get it working. if you have an older version of the program and want to try this out, you'll need to download the vsti midi/rtas bridge available separately from native instruments in the vst audio plug-ins.

Fascinatingly Battery lets you adjust the display in respect of the overall cell pitch. So for example, if a cell is displayed with a low pitch on the screen then the actual physical pitch of that cell

is higher than if the pitch is displayed with a higher overall pitch. This can be used to keep all the Cells pitched equally high, but it's a feature that is sure to take a little getting used to. Still, I can't complain about how intuitive it is. Setting up the Cells is a nice little chore that results in a really pleasingly organised set of samples. If you want to record your own voice you can probably get an excellent performance using the full vocal capabilities of Battery. You can record the entire set of Cello strings in for example, the upper register in the bass and keep all the sounds in sync. I'm really impressed by Battery's ability to work at such a high level of accuracy. If you're recording any instrument that is noise based, or has a complex attack, Battery's oscillator features can help get you a lot closer to a convincing performance than you might be able to

get otherwise. I have yet to work with Acoustic Guitars or other plucked instruments, but Battery will be a real boon to anyone looking for a set of sounds that really resemble the originals. The choice of playing styles, including those ranging from percussion to dance music, and the selection of harmonies and melody instruments means that you won't run out of creative work to do. A really useful addition, especially for those of you who don't want to plough through a load of loops, is the fact that you can hear the samples as Battery plays them back. This is a superb way of testing the quality of a sample before using it.
