we'll test this thoroughly and add a review as soon as it's out of beta, but in its current state it looks like a very good contender indeed. i've given it a run on the new cubase aax 4.1 latest for os x, and the compatibility is fine, with no audio glitches or excessive latency. it's not quite in the same league as steinberg's cepia or polyphony plug-ins on sound forge, but it's clearly a very worthwhile investment for all who use wavelab7 frequently and without wasting time with trial and error, and the new option+key shortcut (4+) to open the gm window has really come in handy too. if you can live without a printed manual, and find the new online help easy to access, you'll find this is the most powerful version yet of wavelab. but one of the best things about wavelab is the fact that it's still a specialist application developed by professional audio professionals for, and with its own close-to-gold standard set ofplug-ins, specialised for the particular audio editing, mixing, mastering and restoration tasks it does so well. all in all, it's a much more flexible and capable application than any of its rivals, and the new wavelab8 version adds a lot to this already comprehensive package. it may be the most

powerful and easy to use all-in-one audio editing system on the market today, but since it is only for the pc, it will remain a specialist tool for serious users. there's a quite extensive audio format chapter at present, coveringflac for pc users, while the mac version also includes lossy aiff and oggfor vorbis audiotext formats, as well as mp3 for aac. wavelab also supportsthe embedded metainformation for almost all audio formats and samplerate/bitrates (including samplerates of just 48khz up to 384khz). wavelab'saudio for pc users supports a subset of the compressed audio-cd formatand also provides a much more compact mp3 format, though the lattermost useful feature for lower-power portable media players and portable harddisks.

each of the audio tracks in your project also now have their own fmi 'record' icon, which can be used to record individual tracks to your hard disc drive, make multitrack splicing edits, or save your work to file. all of this means that you have essentially unlimited control over the audio in your project using the new fmi display pane, and that you can instantly change any of these settings on any of the selected tracks using the 'drag and drop' fmi commands that are now added directly to the 'file' menu. you can even select tracks, and drag and drop the entire project into a new wavelab project using the gui track selection tools. in version 7, tracks were grouped into a simple tracklisting, and you could select a group to view, and make any changes to the track layout if desired, then drag and drop that entire group into another project, or into a new workspace. this functionality has been expanded considerably in wavelab8: you can now separate your tracks into a number of groups which you can apply to either the front, back or surround audio inputs, or to just the master output. you can then rearrange these groups directly in the fmi display pane, and a number of new display, record and analysis options have been added to help you work with your music files. again, you can move your groups into separate fmi project schemas, or into different wavelab workspaces for even greater control. the slider instruments can now make use of clips created by the steinberg audio lab, a tool for creating professional quality loops, as well as adds four new drums, one synth, one percussion and one new soundscape clips.
