More often than not, graphic design is about creating and designing a brand*. This is not magic, it is not a special attribute that only a few can handle. It is a common way of connecting a product, a service, or a company with its target audience. Branding is a creative process that must be done by a graphic designer or a team of graphic designers. To achieve it, these graphic designers need to follow sound methods. They need to be precise and prove themselves accurate. They need to work with the amount of information they have at their disposal. They need to trust their intuition. The standardisation of graphic design must be based on data. This will allow designers who work in different fields and who don't work in the same context, like a client company for instance, to have access to the same amount of information. Graphic design is not based on intuition, it is based on information. Standardisation in graphic design is therefore a necessary development. However, it must not be limiting, and it must not be a monopoly of a discipline. In this way, graphic design will be more open, more accessible, and more useable to all designers.
