I've written other reviews of Adobe products in the past, and I planned to write a quick review of the current state of Photoshop and Acrobat, both standalone and on the Mac. But after diving deeper into Photoshop, the version I have is rather old (10.0). Clearly, that is no longer the most recent release. So I decided Adobe has an actual event for such a thing: the launch of their Flash conferencing solution. I'm going to try to download that later today. Is that even one of the applications I'm going to have to upgrade? 2 GB is about how much of that space Photoshop requires. I've never had a problem with the space Lightroom needs. The product remains as efficient as ever. What is different about Photoshop is that you need to back up your document, just as you would with any other document. I really do not have all of the features you find in Elements. And I've been migrating all of my projects to the cloud. Indeed, cloud technology and the cloud itself is changing Adobe and in some ways is changing photography. But the press often fails to cover the future, just as it does not start with the present. How cloud technology will change photography is a major part of this story, and it will include reviews of Adobe's cloud-based products and the broader ecosystem of online services that are surfacing. Is it possible to do real Photoshop editing in the cloud? I'll have time for a first look later today, when I can play with what the new version offers. I think the real bottom line here is that a version of Photoshop is really a second operating system, and it is a very good one, and that we need that. Lightroom 4 didn't change my photography workflow at all. Photoshop on the other hand, has already changed my pipeline radically.
